

## AERIAL PHOTOGRAPHY

The uses for good quality aerial photography are endless. From simply forming an overview of the land to providing accurate and cost effective identification of terrain and ground features or being the basis of design, photographs are a valuable tool.

The various uses to which aerial photography and imagery can be put include:

- Farmplans;
- Forestry mapping;
- terrain models/contours;
- planimetric maps;
- historical records;
- landscape visualisation;
- design underlays;

Factors to consider include:

- Photography scale – will it be fit for purpose?
- Season – which season will best suit?
- What use will it be put to?

Canmap Hawley can arrange to have site specific or general aerial photography flown to suit your purposes. We have access to historical photography and we can obtain new multi-spectrum digital data such as LIDAR as required.

Canmap Hawley can work on your behalf to project manage the acquisition and analysis of imagery and , using our knowledge of the “big picture”, Canmap Hawley can advise you as to the best way to use the imagery to achieve the best results for you.
